

Introducing Russia's premiere manufacturer of high tech digital diagnostic imaging equipment. We welcome you to our booth to discover the new, highly innovative products that will take you to the forefront of digital technology.

Mobile Acquisition Workstation DIARM MW

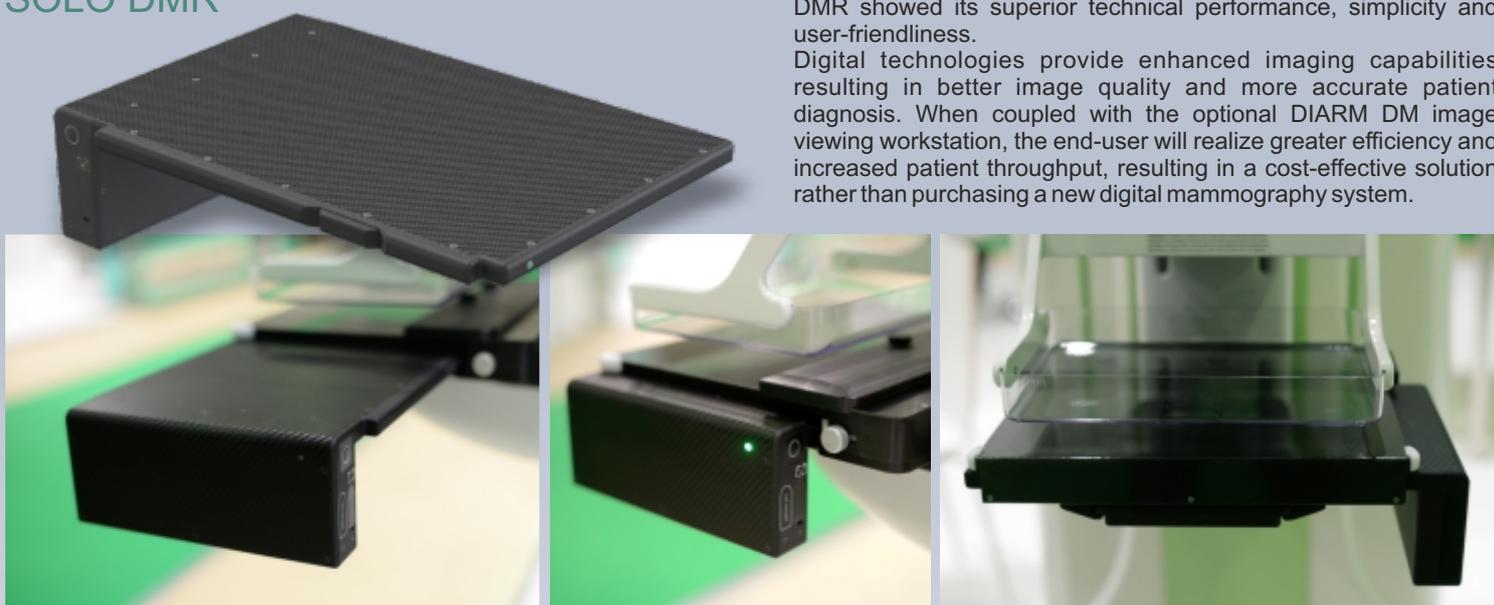

The Mobile DIARM was developed as a portable imaging solution for immediate examinations under complicated field conditions such as search and rescue operations, combat actions and training activities, remote locations, long-distance naval missions, and other pre-clinical extraordinary situations.

Digital Mammography Retrofit Detector SOLO DMR

MTL has developed the world's first wireless portable detector for mammography retrofit upgrade. The tests performed on the SOLO DMR showed its superior technical performance, simplicity and user-friendliness.

Digital technologies provide enhanced imaging capabilities resulting in better image quality and more accurate patient diagnosis. When coupled with the optional DIARM DM image viewing workstation, the end-user will realize greater efficiency and increased patient throughput, resulting in a cost-effective solution rather than purchasing a new digital mammography system.

Mammography Workstation Software DIARM DM

Software dedicated for mammography applications, offering radiologists a set of tools to streamline review of digital mammography images.

DIARM DM has a wide range of options for viewing, analyzing, transferring, and archiving digital images. The software provides the necessary tools for quick, accurate and efficient diagnosis of abnormalities at early stages. A dedicated multifunction keypad is available for fast execution of the most commonly used functions.

The software is extremely versatile and can support a variety of Mammography systems through a DICOM interface. DIARM DM can be installed as a standalone workstation or integrated into existing medical information systems.
